

What is Root Canal Therapy and Why Do You Need It?

Root canal therapy, or RCT, is the treatment of infection and inflammation on the inside of a damaged tooth. When a tooth is compromised by deep cavities or trauma, root canal therapy is used to rid the tooth of infection and retain its natural structure—and the more remaining natural tooth structure, the better.

The GentleWave® Procedure takes a different approach to root canal therapy, using a minimally invasive¹ protocol designed to help preserve optimal tooth structure and promote the long-term sustainability of the tooth.^{1,2,3}

“My GentleWave® Procedure experience was great! It was amazingly fast and easy. What great technology!”
